

Equotip 550 Leeb

Testing of engine cylinder blocks and cylinder heads

Engine cylinder blocks and cylinder heads must be heat treated to avoid excessive wear and tear, and to ensure a long lifetime of the whole engine.

The Equotip 550 Leeb metal hardness tester is performing superbly with high data accuracy and stable testing results directly in the production line. This allows a 100% quality check to comply with the highest quality requirements in this industry. Further beneficial for this application is Proceq's unique Equotip Remote Control Package, which allows real-time fully automated hardness testing, with data automatically fed to ERP systems for complete traceability.
