

Profometer 600

Quick and practical rebar location prior to anchor installation

In this application example, the Profometer 6 was used to locate reinforcement bars in the foundation girders of a public school in Chicago. 15,000 anchors were to be strategically installed in various locations of the concrete girders where reinforcement was not present. The anchors were fitted with external reinforcement bars. This added additional structural strength to the 90-year old concrete foundation girders. In this case, the Profometer 6 scan cart allowed a quick and practical location of the reinforcement bars.
