

Pundit 200 Pulse Echo

## Ultrasonic evaluation of minimum thickness on ground floors

The Pundit 200 Pulse Echo is used as a quality control instrument in the construction industry. It is used to check the thickness of ground floors, whether the minimum thickness was achieved and how much the thickness varies. Destructive testing by core drilling has been used in the past and is still used today but it can only provide information at specific points. Ultrasonic pulse echo technology provides complete information non-destructively.
