

Pundit 200 Pulse Echo

Finding voids ensure continued integrity of the concrete

Proceq's Pundit 200 Pulse Echo and Pundit Lab have been found useful on a number of projects that required non intrusive inspection to identify the potential presence of voids in concrete structures.

In the shown example pictures, surface blemishes were found on wall and kicker areas. Ultrasonic testing was carried out to ensure continued integrity of the concrete. Areas of the concrete that were not required to be investigated were introduced into the survey for comparison purposes.

It was established that the consistency of the concrete placed was uniform and indicated no presence of voids.
