

SilverSchmidt

Assessment of wood deterioration with rebound hammers

The traditional glass and crystal industry often uses wooden forms when undertaking hot glass forming and refinement for their exclusive handmade products. It is important for the producers to know when the wooden forms need to be replaced to avoid a negative impact on the quality.

Proceq’s portable SilverSchmidt rebound hammers provide very accurate hardness values of the measured wood, which provides a precise correlation to the aging and deterioration of the used forms. The SilverSchmidt is very easy to operate on different shapes and can be directly applied during the production.
